

When in standby (i.e., the battery is installed), the AED performs many maintenance activities itself. These include daily, weekly, and monthly self-tests of respectively increasing detail to help verify readiness for use. The defibrillator's extensive automatic self-test features eliminate the need for any manual test, calibration, or energy verification.

AED manufacturers are likely to recommend the following frequency for these inspections.

- Daily, check the status indicator to verify that the device has passed its latest self-test and is therefore ready for use.
- Monthly, check supplies and accessories for damage and expiration dating

This recommendation is intended to address a wide range of user situations. Inspection at different frequency intervals may be appropriate, depending upon the environment in which the defibrillator is used.

### AED Inspection Service includes

- In-person visual inspection
- Loaner AED
- AED recall notifications
- AED serial & accessory tracking (pads and batteries)
- Discount on replacement/accessories
